

ABSTRACT OF THE DISCLOSURE

A deployable lightning protection apparatus particularly suited for use with an aircraft radome comprises[[:]] a source of electrically conducting fluid, [[(5);]] a deliver apparatus which delivers ~~means (3,4,7) for delivering~~ the conducting fluid flow across to the surface of the radome prior to a lightning strike; and a control unit ~~means (1,2)~~ for controlling the delivery ~~means; and means for directing the~~ apparatus. The conducting fluid across the outer surface of the radome ~~thereby providing~~ provides a conductive ~~channel~~ path for the passage of electrical current resulting from a lightning strike and dissipating said current without damage to the radome. The apparatus allows lightning protection to be deployed in response to a change in atmospheric conditions indicative of a high probability of lightning strike and removed when the danger of lightning strike has passed.
